### LIFE CYCLE OF PEARL OYSTER

- Pearl oysters have been reported to live as long as 25 years. Pearl oysters reproduce by releasing millions of eggs or sperm into the water column, where fertilization occurs randomly.
- The unfertilized eggs are irregular or becoming spherical when fertilized.
- In less than 24 hours, the fertilized egg develops into a trocophore larva, a free-swimming organism.
- The larvae remain suspended in the water column for 2-3 weeks before undergoing metamorphosis, changing into an attached juvenile "spat."
- Shortly before metamorphosis, the larva develops an enlarged foot and an eye-spot.
